

IDOLL - Independent Dollar

Short Information Whitepaper

Version 1.0 | May 2026

IDOLL is a BNB Smart Chain soft-pegged digital dollar asset within the Independent Digital Finance ecosystem. It is designed for transparent on-chain liquidity, live AMM market activity, measured liquidity-pool growth, and public market-data visibility. This document summarizes the purpose, mechanics, supply profile, market infrastructure, and risk considerations for IDOLL.

1. Overview

Independent Dollar (IDOLL) is the first dollar-referenced liquidity asset of the Independent Digital Finance (IDFI) ecosystem. IDOLL is not presented as a bank deposit, security, or guaranteed redemption product. It is an on-chain token with a soft dollar reference supported by liquidity management, market-flow discipline, and transparent AMM activity.

The initial live market is IDOLL / USDT on PancakeSwap V3 on BNB Smart Chain. Public users can verify the token contract, pool address, transaction history, and market data through BscScan, DexScreener, GeckoTerminal, DexTools, and PancakeSwap.

2. Core Objectives

IDOLL focuses on transparent liquidity infrastructure instead of opaque collateral claims or unrealistic yield promises. The project prioritizes sustainable liquidity-pool growth, public market tracking, and steady market activity.

The IDFI strategy starts with a single active BSC market and expands gradually. The goal is to strengthen liquidity, improve market history, document operations, and build organic community attention before wider exchange or aggregator integrations are pursued.

3. Token and Market Details

Field	Value
Token name	Independent Dollar
Symbol	IDOLL
Network	BNB Smart Chain
Contract address	0x8E9AdB904824fDfBEc1a5f15c4146a23dc3453EF
Pair	IDOLL / USDT
Pair address	0xE140405d26AaAB39A05aB7E9ee8EaEba30C9B292
DEX	PancakeSwap V3
Pool fee	0.25% / 2500
Decimals	6

4. Supply Information

IDOLL is designed with an uncapped maximum supply model. Minting is operationally limited by contract rules and project policy. The contract includes a daily minting limit of 100,000 IDOLL. Total supply and circulating supply should be checked on-chain and updated in public profiles as the supply changes.

At the time this short whitepaper was prepared, the initial public supply information used for listing and documentation purposes was 200,000 IDOLL. The project intends to keep supply information aligned with public explorer data and market documentation.

5. Liquidity Model

The IDOLL / USDT market uses PancakeSwap V3 with a 0.25% pool fee tier. Liquidity is added through defined ranges. A tighter range can support stronger depth near the active market price, while wider positions can reduce pressure from short-term price movement.

The project uses transparent LP tracking and reports market data from public sources. Liquidity additions are intended to be gradual so that market behavior remains measurable and sustainable.

6. Market Activity and Rebalancing

IDFI uses bot-assisted market-flow tools to support measured buy and sell activity, wallet rotation, and live AMM volume. These tools are operational infrastructure and do not remove normal market risk.

Rebalancing and manual liquidity operations may be used to support the soft-dollar reference range. Operations are intended to be conservative, observable on-chain, and adjusted according to liquidity depth, price movement, and wallet balances.

8. Risks and Disclosures

IDOLL is an experimental DeFi token. It has smart-contract risk, liquidity risk, market risk, wallet risk, execution risk, and operational risk. A soft peg is not a guaranteed redemption right. Market price can move above or below the reference value depending on liquidity, trading activity, and broader market conditions.

Users should verify contract addresses, pool addresses, and official links before interacting. The project does not promise fixed returns, guaranteed profits, or guaranteed exchange listings.

9. Roadmap Direction

The near-term roadmap is focused on documentation, explorer profile improvements, public market-data visibility, LP growth, BscScan token information updates, and gradual community development.

After stronger liquidity, market history, and community presence are established, the project may pursue additional aggregator visibility, exchange listings, and future Solana-side expansion under the IDFI ecosystem.
